PEP Report 29M

Reduced Carbon Intensity Ethylene Production

Subodh Sarin, Director
Rajesh Verma, Director
Rajeev Singh, Principal Research Analyst

Abstract

Ethylene is the largest-volume basic petrochemical, produced primarily by steam cracking of hydrocarbons (naphtha, gas oil, ethane, and LPG) and is utilized to produce a spectrum of chemical intermediates. Ethylene consumption has been increasingly driven by its demand in emerging countries and the consumption has increased at an average rate of ~4% per year over the past decade.

Ethylene production is one of the three largest CO₂ emitters in the chemical industry; the other two are that of propylene and ammonia. Conventional cracking generates roughly 1–1.8 metric tons (Mt) of CO₂ for every metric ton of ethylene produced. Globally, that amounts to more than 260 million tons of CO₂ emissions per year.

This report provides an overview of the developments in ethylene production technology with a focus on reduced carbon intensity. Numerous technological advancements have been presented which significantly reduce CO₂ emission from ethylene plants. Detailed technical and economic evaluations are presented for the following three technologies with reduced carbon intensity for ethylene production:

• EcoCatalytic chemical looping technology
• Coolbrook’s roto dynamic reactor (RDR) technology
• Electric furnace technology

The analysis and techno-economic design results for the above three technologies are based on the production of 1 MMtpa polymer-grade ethylene. Electric furnace and Coolbrook’s roto dynamic reactor have been evaluated with wide range naphtha (WRN) as feed while the design of the EcoCatalytic technology will be based on ethane feed. The capital and production cost results herein are presented for the fourth quarter of 2020 on a US Gulf Coast basis.

The analysis is based on information by the technology provider presented in the open literature (such as patents or technical articles) or in-house generated data (e.g., HYSYS simulation, equipment cost estimation). While this assessment may not reflect the actual plant data fully, we do believe that it is sufficiently representative of the process and process economics within the range of accuracy necessary for economic evaluations of a process design.
Contents

1 Introduction 10
2 Summary 11
   Process economics 12
   Energy and carbon intensity 12
   Impact of cost of electricity on the process economics 13
3 Industry status 16
   Characteristics of the market 17
4 Technology review 20
   Decarbonization measure in a steam cracker 20
      Coke inhibition technology 21
      Mechanical device for enhanced heat transfer 21
      Mechanical device for increased surface area 21
      Mechanical device for increased heat transfer coefficient 21
      Surface technologies 22
         Aluminum-based alloy 23
         Ceramic material 23
         Permanent surface coatings 24
         Feed additives 24
      Method to improve furnace thermal efficiency 25
         Combustion air preheat 25
         Gas turbine integration 25
         High-emissive refractory coating 25
         Heat recovery scheme 26
      Alternate feedstock and fuel for olefins production 27
         Bio-naphtha 27
         Bio-ethanol 28
         Bio-methanol 28
         Pyrolysis oil 28
         Biogas as fuel 28
         Hydrogen as fuel 28
         Oxy-fuel combustion 29
      Carbon capture in an ethylene plant 29
      Carbon capture and utilization 29
   Technology readiness level 30
      Oxidative dehydrogenation of ethane (ODHE) 30
         Chemical looping 32
         Catalysts 34
      EcoCatalytic chemical looping process for ethylene production 35
      Acetylene hydrogenation 44
      Ethylene and propylene recovery system 45
   Coolbrook RDR reactor [US 20210171836A1, 202129112] 46
      Background 46
      Current status 49
   Electric furnace for steam cracking 49
      Ohmic or joule heating 50
      Induction-heated reactor 51
      Microwave/radio frequency (RF) heating 52
      Latest development by petrochemical players 53
      BASF electric furnace technology 54
5 Ethane oxidative dehydrogenation of ethylene production using EcoCatalytic chemical looping technology

- Basis of design
- Material of construction
- Storage tanks

Process description
- Ethane ODH reaction and catalyst regenerator (Section 100)
- ODH reaction effluent compression and de-methanizer (Section 200)
- Ethylene recovery section (Section 300)
- Propylene recovery section (Section 400)
- Ethylene and propylene refrigeration system
- Hydrogen purification (PSA) system
- CO, CO\textsubscript{2} gases removal system

Process discussion
- Reactor/regenerator system
- CO\textsubscript{2} recovery option
- Front-end DeC1 vs front-end DeC2
- Propylene recovery option

Emission and wastes

Cost estimates
- Fixed capital costs
- Production costs

6 Naphtha cracking for ethylene production using Coolbrook RDR technology

- Basis of design
- Storage tanks

Process description
- Section 100—Pyrolysis and quench
- Cold section
- Section 200—Compression, drying, and de-propanizer
- Section 300—Subcooling and separations
- Section 400—Product separation
- Section 500—Refrigeration
- Section 600—Steam distribution

Process discussion
- Impact of renewable electricity on process economics
- Potential to use renewable electricity
- Specific energy calculation
- Steam system design
- Stage of development of technology
- Product slate
- Ethylene cracker with RDR—configuration options
- Number of furnaces
- Cold section design
- Environment
- Material of construction (MOC)

Carbon and water footprint

Cost estimate
- Fixed capital costs
- Production costs

7 Naphtha cracking for ethylene production using electric furnace technology

- Basis of design

Process description
- Section 100—Pyrolysis and quench
- Section 200—Compression, drying, de-propanizer
Section 300—Subcooling and separation 130
Section 400—Product separation 130
Section 500—Refrigeration 131
Section 600—Steam distribution 131

Process discussion 151
Impact of cost of renewable electricity on the process economics 151
Potential to use renewable electricity 151
Specific energy calculation 151
Electric furnace yield 151
Steam system design 152
Number of furnaces 152
