Monthly Performance Recap

US:

Within the US Large Cap universe, most models performed well. The Historical Growth model had the strongest one month decile return spread performance, returning 6.66%. Over the US Small Cap universe, the Earnings Momentum model had the strongest one month decile return spread performance, returning 8.01%. On the 12-month basis, the Value Momentum 2 model performed best at 30.14% while the performance of the Deep Value model continued to lag.

Developed Europe:

Over the Developed Europe universe, our Earnings Momentum model returned 5.55% on a one month decile return spread basis. On a 12-month basis, the Relative Value model performed the best, at 27.94% cumulative.

Developed Pacific:

Over the Developed Pacific universe, the Earnings Momentum model had the strongest one month decile return spread performance, returning 1.25%, while the Price Momentum model lagged. The Deep Value model led the performance over the recent one year, delivering 25.33%. The models struggled over the Developed Pacific universe during the month.

Emerging Markets:

Within the Emerging Markets universe, the Earnings Momentum model returned 1.82% on one month quintile return spread basis. The Price Momentum model led over the one-year period, with returns at 19.61%.

Sector Rotation:

The US Large Cap Sector Rotation model returned 1.60%. The Cyclical sector had a favorable ranking and the Basic Materials sector had an unfavorable ranking. The US Small Cap Sector Rotation model earned a return of 2.90%. The Non-Cyclicals sector had a favorable ranking and the Energy sector had an unfavorable ranking. The Developed Europe Sector Rotation model struggled during the month. The Financials sector had a favorable ranking and the Energy sector had an unfavorable ranking.

Specialty Models:

The Retail model's one year cumulative performance was the highest at 44.07% while the REIT 2 model's performance was the lowest at 2.45%. Within the specialty model library the Insurance and the Oil and Gas models had the strongest one month quintile return spread performance returning 6.96% and 3.55%, respectively, while the Semiconductor and the Technology models struggled.

REIT: All US REITs that are part of the US Total Cap universe (top 98% of US stocks), excluding mortgage REIT's.

Retail: All Retail companies in the US Total Cap universe (top 98% of US stocks), including those in the Cyclical and Non-Cyclical sectors.

Semiconductors: Global securities classified in the Semiconductor industry.

Technology: All Technology companies in the US Total Cap universe (top 98% of US stocks).

1.2 MODEL DESCRIPTIONS

Deep Value Model (DVM): seeks to identify securities trading at a steep discount to their intrinsic

Earnings Momentum Model (EMM): incorporates analyst forecasts alongside in conjunction with past earnings strength to estimate future earnings potential.

Price Momentum Model (PMM): seeks to combine price changes with several risk factors to provide a consistent short term investment signal.

Relative Value Model (RVM): an alternative approach to the DVM that considers valuation indicators on an industry adjusted basis thus mitigating any concentration risk.

Value Momentum Analyst (VMA): a comprehensive style model which includes factors from Value, Price and Earnings Momentum themes to identify attractive/ unattractive securities.

GARP Model (GARP): designed to identify attractively valued stocks using valuation techniques that take growth into consideration. The Valuation component selects stocks with attractive valuation characteristics.

Historical Growth Model (HGM): identifies stocks with an above-average track-record of earnings growth, strong sales growth and high sustainable growth. This blended approach enables our Historical Growth Model to not only identifies traditional growth stocks, but also value stocks on the verge of growth.

Small Cap Model: seeks to exploit the noticeable excess performance in the small cap arena. Constituent factors selected for its individual and orthogonal power within the small cap space.

Bank and Thrift II Model (QBM2): seeks to generate consistent outperformance by leveraging specialty data sources to create bank-and-thrift-specific factors which complement a set of broad factors exhibiting strong performance within the bank and thrift industries.

Insurance Model (QIM): provides a robust methodology to enhance stock selection processes by comparing the relative performance of insurance companies on a consistent valuation framework designed to identify stocks with significant alpha generating potential.

Oil and Gas Model (OGM): uses a comprehensive scoring system that systematically values companies utilizing energy specific operating metrics and fundamental factors relevant to the oil and gas industry.

Retail Model (QRT): designed to generate alpha by employing general factor signals alongside key retail specific measures. Retail specific indicators include Same Store Sales and Earnings Expectations.

REIT Model (QRM): incorporates detailed property level information such as occupancy rate, location, and building quality to construct a bottom up approach assessment of REIT Net Asset Value; along with several other metrics.

Technology Model (QTA2): a multidimensional approach of combining several industry-specific models with a cross-sectional overlay. The model seeks to generate alpha by accounting for the inherent cyclicity and volatility of sub-industries.

1.3 PERFORMANCE STATS CALCULATION

The reported Information Coefficient (correlation between model ranks and equity return) is the average over the given time period. The reported Decile 1 and Decile 10 Excess Returns are Cumulative Sum (CUMSUM) and are measured as the excess return of their respective benchmark over a given time period

The reported Decile 1 Excess Returns and Decile 10 Excess Returns are Cumulative Sum (CUSUM) returns and are measured as the excess return of their respective benchmark over the given time period.

The reported Long-Short Spread Returns are Cumulative SUM returns and are calculated by subtracting the total returns of stocks in the bottom decile/quintile from those in the top decile/quintile over the given time period.

Quintiles are used for performance stats calculations, instead of deciles, in cases of smaller universe sizes.

The reported performance stats are all in local currency.
