

**Loan Processor**

# Integrating global lending systems via electronic messaging to eliminate risk and improve operational efficiencies.

**Today's challenge:** Institutions which are not fully electronically integrated to Loan Platforms do not have the luxury of redeploying capital resources to facilitate increased trade volume and velocity. Electronic integration between Loan IQ and our lending solutions can be extremely costly and time-consuming to implement and maintain. Also, the dual keying of actions into both can significantly increase operational risk and hinder growth and velocity.

**Introducing Loan Processor** our specialized workflow tool; connecting Loan IQ to our lending solutions and revolutionizing the servicing and settlement lifecycles.

The entire settlement workflow from the perspective of the agent, buyer, and seller is housed within Loan Processor. It facilitates sending trades to ClearPar, booking allocations back into the agent system without manual intervention, performs seller position calculations, and allows users to perform all ClearPar trade workflow steps within the user's own environment.

Integration also allows the agents to post holdings in real time, allowing lenders to access holdings and reconcile from source data delivery into our Loan Reconciliation solution – including the automation of affiliate letters, lender identifiers, and with messaging wire instructions updates consumable as data.

## Tomorrow's model, today

Agency trade settlement is transformed via Loan Processor. Constant position calculations are performed on all open trades, so the heavy burden of position checks is taken off the agent's hands. Alongside other automated workflows, including SSI verification, party affiliation and borrowers consent, these all help agents to create a flexible configurations that allow trades to be systematically executed in bulk at given intervals. Loan Processor also transforms the day-to-day operations agents face, by creating scale and efficiency whilst reducing operational risk.

Real-time position, wire instruction, and Markit Entity Identifier (MEI) updates will fuel a transformed settlement workflow.

## Seamless settlement workflow

Servicing and maintaining non-agented deals becomes seamless with the introduction of our world-class loan reference data. Over 150 data points per facility brings further transparency and efficiencies, by showing real-time market surveillance, valuation, credit analysis and performance attribution, as well as corporate actions, amendments and restructures. Lenders can also create workflows and increase automation around inbound loan event notices with our Notice Manager capability, purpose-built into Loan Processor.
